

**ABSTRACT OF THE DISCLOSURE**

In a housing assembly for an electronic device, a pivot housing is connected pivotally to a pivot side of a base housing, has an inner surface opposite to an outer operating surface, and is rotatable relative to the base housing about a first axis such that the pivot housing is operable so as to move from a closed position, where the inner surface of the pivot housing is disposed to confront an inner operating surface of the base housing, to an open position, where the inner surface of the pivot housing is spaced apart from the inner operating surface of the base housing. A rotatable main housing is disposed adjacent to the base and pivot housings, is connected rotatably to the pivot housing, and is rotatable relative to the pivot housing about a second axis parallel to the first axis when the pivot housing is disposed in the open position.
